

An interview with the Formats

Tobias C. as Narrator and BMP Guy

Alexia Chavez. as Miss JPEG

Elham Timory as Dot PNG

Melissa Medina as Madame TIFF

The Formats

Welcome to the show

- Welcome to the talk show, where we interview! Today we have four famous image formats who have come to participate to see who is the best.
- However, these image formats aren't intentionally designed to have the same purpose. These formats have a unique strength, a weakness, and a common use.
- Without further ado, time to introduce...

Miss. JPEG

- Hello everyone! My name JPEG is an abbreviation for Joint Photographic Experts Group.
- I am commonly used for photographs, websites, cameras, and social media, hence why I'm one of the most popular image formats in the world!
- Fun fact about me is that I use lossy compression to reduce my image size, and that's because that helps me speed up upload/download speed without anyone noticing what was removed! The smaller the size, the faster!

Dot PNG

- Hey everyone! I'm Dot PNG (.png)! My name is an acronym for Portable Network Graphics.
- One thing about me is that I use lossless compression, which means that I keep all data on the image while also shrinking the size of the said image.
- I have a special ability that no one has – transparency. It make me useful for things like logo and icon design, as well as screengrabs. I am also widely used on the web!

BMP Guy

- What's up guys. I'm BMP. It's short for Bitmap.
- I'm basically the biggest in the group because I carry every pixel uncompressed as raw data. Nothing refined, basically just raw data.

Madame TIFF

- *Bonjour, mesdames et messieurs!* I'm Madame TIFF, short for Tagged Image File Format, but many people just call me Madame Tiff or Tiffany!
- I store a lot of detailed image information and therefore am used in things like professional photography, printing, scanning, publishing, and archiving, hence why I am a French maid!

What are your strengths and weaknesses?

Miss. JPEG

- What's positive about me is that I can produce small files while keeping photographs visually attractive! I'm supported basically everywhere, so everywhere you go, you'll see me all over the place!
- However, a weakness that I have is that my lossy compression can remove information! Be warned, if you save an image under my name, you'll degrade the quality of your image! Unfortunately, I don't support transparent backgrounds.

Dot PNG

- Unlike my JPEG counterpart, I am capable of supporting transparency, which is a reason why I am used for graphic / web design! Also, I always preserve the quality of the image though lossless compression!
- However, I have faced some difficulty when it comes to size, and that is because my images are slightly larger than JPEG's, especially when dealing with detailed photographs.

BMP Guy

- I have a very simple and direct structure and this is because I store every pixel without compression, which means full preservation of image data without artifacts.
- A disadvantage to this is that I am huge, larger than JPEG because I do not use compression.

Madame TIFF

- As a maid, I always preserve the images at excellent quality and information! Plus, my data and quality protection makes me useful for photographers and computer scientists as well!
- Unfortunately, my images can be large and I do not work on some websites and applications, so I'm not used that often.

The conclusion

- After listening to the contestants, and their strengths and weaknesses, it appears that everyone wins.
- Everyone wins because the best image format depends on the intended purpose.
- While each image format has a different purpose given their unique properties, it can be concluded that the real skill is not choosing one format for every task, but instead the real skill to this is understanding what the image needs.
- As mentioned, even though different image formats have a different purpose, the main lesson is that no matter the image format, all of them are capable of doing any job.

End
